

The role of the International Atomic Energy Agency in developing the System of Radiation Protection

Gerhard Proehl

Division of Transport Radiation and Waste Safety

Seminar

“Expert Programme of Environmental Management and Prognosis of Nuclear Emergencies”

Tsukuba (Japan), 9 July 2017

IAEA

International Atomic Energy Agency

Some details about the IAEA

The International Atomic Energy Agency

Founded in 1957

- Part of the United Nations family
- A science and technology-based organization

Verification of the Non-Proliferation Treaty and agreements

- International treaty
 - to prevent the spread of nuclear weapons and weapons technology
 - to promote cooperation in the peaceful uses of nuclear energy,
 - to work for achieving nuclear disarmament and general and complete disarmament.
- IAEA to perform regular inspections of nuclear facilities in Member States
- Check compliance with the commitment to use nuclear material and facilities only for peaceful purposes

1957

The International Atomic Energy Agency II

- **Assistance of Member States**

- Using nuclear techniques in research and industry
- Generation of electricity
- Transfer of technology and knowledge to developing Member States

Safety of nuclear techniques

- **Develops nuclear safety standards**

- To ensure safety for nuclear application
- Protection of human health and the environment against ionizing radiation

Safety of nuclear facilities

Safety of transport

Development of International Standards

UNSCEAR

United Nations Scientific
Committee on the
Effects of Atomic
Radiation:

**Scientific Reports:
Radiation effects**

ICRP

International
Commission on
Radiological Protection

**What are appropriate dose
limits?
For people
For workers**

IAEA

International Atomic
Energy Agency

Safety Standards

**Nuclear Safety
Management of radioactive
waste
Discharge of radionuclides to
the environment**

UNSCEAR: United Nations Scientific Committee on the Effects of Atomic Radiation

- **Evaluation of all sources of exposure to radiation**
 - Natural radiation
 - Cosmic and terrestrial radiation
 - Inhalation of radon and radon daughters
 - Intake of natural radionuclides with food:
H-3, C-14, K-40, Po-210, Ra-226/228, thorium and uranium isotopes
 - Current levels and trends of exposure
- **Analysis of studies on ionizing radiation**
 - Effects on human health
 - Effects on wildlife
- **UNSCEAR reports directly to the United Nations General Assembly**
 - Represent a consensus of the UN Member States on effects of ionizing radiation

Global average of doses to the public from natural radiation sources (UNSCEAR, 2008)

Source		Annual effective dose (mSv/a)	
		Average	Range
Ingestion		0.3	0.2 - 1
⁴⁰ K		0,17	
U- and Th-series		0,12	
Cosmogenic radionuclides		0,01	
Inhalation		1.26	0.2 - 10
U- Th– series		0,006	
Radon (²²² Rn/ ²²⁰ Rn and decay products)		1,25	
External exposure		0.87	0.6 - 2
Cosmic radiation (at sea level)		0,39	0,3 - 1
Natural radionuclides in soil		0,48	0,3 - 1
Total annual average		2.4	1 - 13

IAEA

Lifetime dose from natural sources: about 200 mSv

ICRP: International Commission on Radiological Protection

- **Founded in 1928**

- Work was initiated because of the effects observed following applications of radiation
(e.g. x-rays) in medicine

- **Analysing the knowledge on radiation-related health risks**

- Radiation effects (as provided by UNSCEAR) in dependence of
 - Exposure (total doses and dose rates)
 - Age and gender
 - Pathway (external/internal exposure)
 - Dosimetry

(e.g. dose per unit intake: Sv per Bq for intake with food,
Sv per Bq for inhalation)

- **Providing recommendations for radiation protection**

- E.g. dose limits, reference levels
- Basis for developing radiological protection standards world-wide

Fundamental Safety Principles

Requirements: What to do?

Safety Fundamentals

Safety Requirements

Safety Guides

Safety Requirements

Safety Guides

The image shows the front cover of an IAEA publication. At the top, a dark blue horizontal band contains the text 'IAEA Safety Standards' in white, with 'for protecting people and the environment' in a smaller font below it. The main title 'Predisposal Management of Radioactive Waste' is printed in a large, bold, black serif font. Below this, in a smaller black serif font, is 'General Safety Requirements Part 5' and 'No. GSR Part 5'. At the bottom left is the IAEA logo, which consists of a stylized atom symbol inside a circle, followed by the text 'IAEA' and 'International Atomic Energy Agency' in a smaller font.

**IAEA
SAFETY
STANDARDS
SERIES**

**Safety Assessment for
Near Surface Disposal
of Radioactive Waste**

SAFETY GUIDE

No. WS-G-1.1

 INTERNATIONAL

AGENCY

Best Practice to meet Requirements: How to do?

SAFETY FUNDAMENTALS

General Safety Requirements

Vol.1 Governmental and
Regulatory Framework

Vol.2 Leadership and Management
for Safety

Vol.3 Radiation Protection and
Safety of Radiation Sources

Vol.4 Safety Assessment

Vol.5 Predisposal Management
of Radioactive Waste

Vol.6 Decommissioning and
Termination of Activities

Vol.7 Emergency Preparedness
and Response

Specific Safety Requirements

1. Site Evaluation for
Nuclear Installations

2. Safety of Nuclear Power Plants

2.1 Design and Construction
2.2 Commissioning and Operation

3. Safety of Research Reactors

4. Safety of Nuclear Fuel
Cycle Facilities

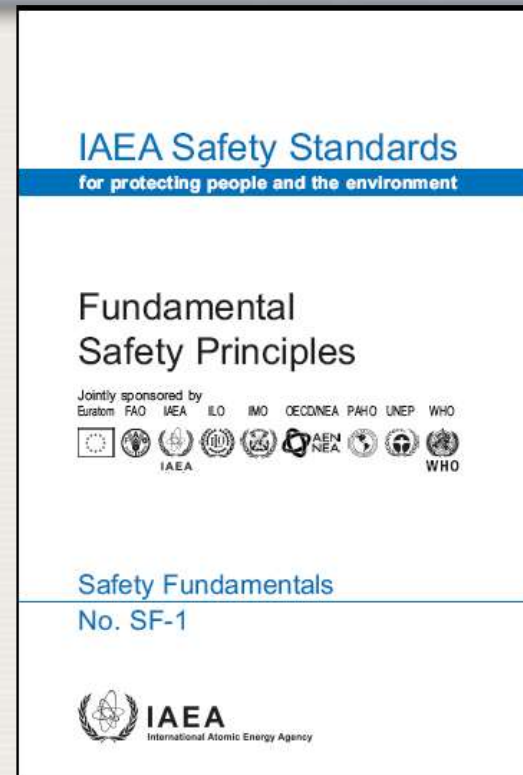

5. Safety of Radioactive Waste
Disposal Facilities

6. Safe Transport of
Radioactive Material

Collection of Safety Guides

Safety Fundamentals: 10 Safety Principles

- 1 **Responsibility** for safety
- 2 Role of **government**
- 3 Leadership and **management** for safety
- 4 **Justification** of facilities and activities
- 5 **Optimization** of protection
- 6 **Limitation** of risks to individuals
- 7 Protection of present and **future generations**
- 8 **Prevention of accidents**
- 9 **Emergency preparedness and response**
- 10 Protective actions to **reduce existing or unregulated** radiation risks

IAEA Basic Safety Standards (BSS)

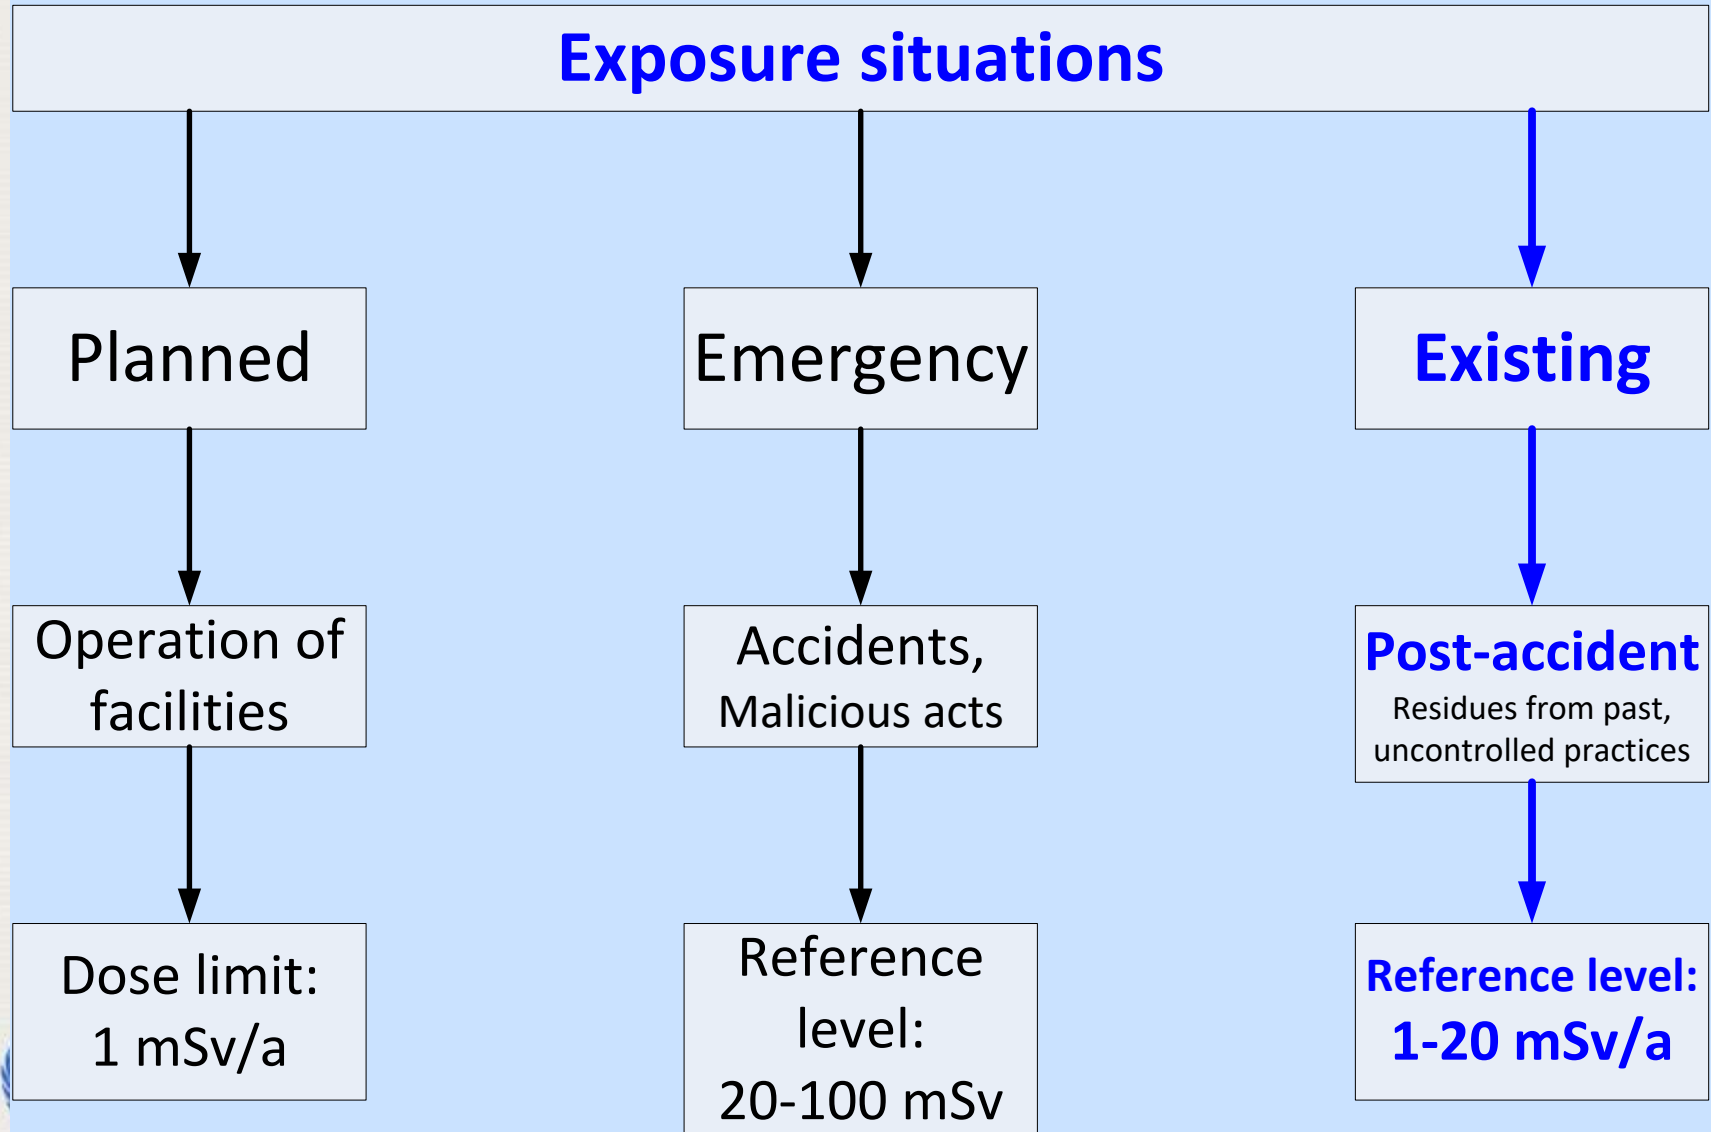

- Represents **international consensus** on Radiation Protection
 - Based on ICRP 103 (2007)
- **Defines responsibilities**
 - Government and regulatory body
 - Operator
- **Defines exposure situations**
- **Radiation protection principles**
 - Justification, Optimization, Limitation
- **Radiological criteria**
 - Public in all exposure situations
 - Workers

System of Radiation Protection

- ***Three exposed groups***
 - Workers
 - Patients
 - General public
- ***Three Exposure Situations***
 - Planned exposures
 - Emergency
 - Existing exposures
- ***Three Radiation Protection Principles***
 - Justification
 - Limitation
 - Optimization

Three exposure situations for *Public exposure*

Radiation Protection Principles

Radiation Protection Principles

Justification

Actions should be
adequate to the risk

Do more good
than harm

Optimization

Exposure levels
Number of people exposed
Economic and social
implications

As Low As Reasonably
Achievable, economic and
social factors being taken
into account
(ALARA)

Limitation

Limitation of doses
and associated
risks

Dose limits
Reference levels

Remediation of Affected Areas

2007

*Currently being
updated*

IAEA Safety Standards for protecting people and the environment

Remediation Process for Areas Affected by Past Activities and Accidents

Safety Guide
No. WS-G-3.1

Technical documents for application of the Safety Standards

1982

2001

Summary

- **Radiation Protection System**
 - Internationally agreed
 - Based on science
 - Includes all relevant exposure situations
 - Implemented in many Member States
- **Implementation within National Responsibilities**
 - Guidance provides by IAEA Safety Standards
- **Embedded in International Conventions**

Thank you!
